

System integration perspective

Data has become more central to the institution. The institution has the resource to implement RDM.

- Institutional priorities
 - Compliance first
 - Management or research assets
 - Generalised scope
 - Ensuring accessibility and accreditation
 - Trying to ease the pain a bit

The researcher makes the data

- Researcher priorities
 - Project first
 - Ease of use / collaboration
 - Accreditation
 - Accessibility
 - Compliance

Though the institution has the resource for this, most probably don't have the budget to meet the needs of each and every researcher... or do they?
